The ODVA Automotive Special Interest Group (SIG) is pleased to offer this document as a tool for troubleshooting devices that have been implemented into a DeviceNet network as well as the DeviceNet network itself.

The following individuals have been invaluable in putting this document together:

**Training Committee Members:**

Matt Kuzel  
Borisa Begic  
James O’Laughlin  
Erick Rudaitis  
Michael Giroux  
Huron Networks  
InterlinkBT  
SICK, Incorporated  
SMC Corporation of America  
WAGO Corporation

**Automotive SIG Members:**

Erick Rudaitis, Chairperson  
Marie Sandor, Administration  
SMC Corporation of America  
SMC Corporation of America  

Thomas Dwyer  
Greg Irwin  
Gil Jones  
Frank Latino  
Matt Kuzel  
Borisa Begic  
Gary Workman  
Enrico DeCarolis  
Anton Suarez  
Dave VanGompel  
James O’Laughlin  
Ed Ingraham  
Mike Johnson  
Michael Giroux  
Chuck Sammut  
Bosch Rexroth  
DaimlerChrysler  
EATON Corporation  
Festo  
Huron Networks  
InterlinkBT LLC  
General Motors  
Numatics, Inc.  
OMRON Corporation  
Rockwell Automation  
SICK, Incorporated  
Siemens  
SOLA / Hevi Duty  
WAGO Corporation  
Woodhead

For more information regarding the ODVA, including the Automotive SIG, please refer to the ODVA website at:

Plant Floor Troubleshooting Guide

DeviceNet Plant Floor Troubleshooting Flowchart
(Suspected Network Error / Multi-Node Problem)  See Page 1

DeviceNet Plant Floor Troubleshooting Flowchart
(Intermittent Failures)  See Page 11

DeviceNet Plant Floor Troubleshooting Flowchart
(Single Node Problem)  See Page 15

Walking the Network  See Page 19

Segmenting the Network to Troubleshoot  See Page 20

DeviceNet Network Checklist  See Page 21
Start 1: DeviceNet Plant Floor Troubleshooting Flowchart
(Suspected Network Error / Multi-Node Problem)

- Are the DeviceNet scanner LEDs red (Bus off)?
  - Yes: Turn Auxiliary and DeviceNet Power OFF, Wait 10 seconds, Turn back ON. Examine scanner LEDs
  - No: Note any diagnostic information on DeviceNet scanner if available.

- Are the DeviceNet scanner LEDs red (Bus off)?
  - Yes: Cycle System, Auxiliary and DeviceNet Power, Wait 10 seconds. Examine scanner LEDs
  - No: Go to O (See Page 11)

- Are the DeviceNet scanner LEDs red (Bus off)?
  - Yes: Review Walk the Network
  - No: Go to B (See Page 2)

- Attach DeviceNet Diagnostic Tool

See Page 19
B

Was problem found during the network walk?

Yes

Done

No

Is there only one node with red Module (MS) or Network Status (NS) LEDs?

Yes

Go to E

See Page 4

No

Disconnect DeviceNet trunk cable from the cabinet with scanner module. Attach terminating resistor. Turn off DeviceNet power, wait 10 seconds, turn DeviceNet power back on.

Are the DeviceNet scanner LEDs red (Bus off)?

Yes

Check nodes and cabling inside cabinet.

No

Reconnect network.

Are there multiple DeviceNet network power supplies?

Yes

Disconnect supplemental power supplies.

Go to C

See Page 3

No

Go to F

See Page 5

Go to D

See Page 3

Problem fixed?

Yes

No

Done
**C**

Is V- of the power supplies tied to V- of DeviceNet?  
Yes  
> Wire V- of all power supplies together. Reconnect trunk cable.
  
No  
> Wire V- of all power supplies separately. Reconnect trunk cable.

---

**D**

Are the nodes and cables okay?  
Yes  
> Replace scanner.
  
No  
> Replace cable or node.
  
Reconnect network.

---

Go To Start 1  
See Page 1
Disconnect node from network. Turn Auxiliary and DeviceNet Power OFF. Wait 10 seconds. Turn back ON.

Note: Other nodes can cause a node to go offline.

Are the DeviceNet scanner LEDs red (Bus off)?

Yes

Replace drop cable.

Replace node. Verify Baud Rate, Node Address and .EDS file information.

Are the DeviceNet scanner LEDs red (Bus off)?

No

Yes

Go to F

See Page 5

Done
Have any changes been made to network since last time worked consistently?

No

Check Voltages
See Items 12, 13 & 14 in DeviceNet Network Checklist

Are DeviceNet voltages correct?

No

Change power supply

Go to G
See Page 6

Yes

Investigate changes

Go to Start 1
See Page 1

Note: Changes such as cabling, tools, firmware, nodes, etc.
No

Bus off condition fixed?

Yes

Done

No

Complete DeviceNet Network Checklist

See Page 21

Errors found and fixed?

Yes

Done

No

Check Voltages

See Items 12, 13 & 14 in DeviceNet Network Checklist

See Page 23

Voltages OK?

Yes

No

Go To

See Page 7

Note: This will now take some time. Check
1. Cables, 2. Node,
3. Segment, 4. Grounding
5. CAN transceiver shorted
6. Not 60Ω etc.
All cable connections OK?

Yes

Fix cable connection

No

Attach DeviceNet diagnostic tool and measure CAN errors

> 20 errors/second?

Yes

Recheck for ground loops using DeviceNet Network Checklist

No

Problem found and fixed?

Yes

Done

No

Go to J

See Page 8

Go to K

See Page 8

See Page 1

Go to Start 1

See Page 1

See Page 21

See Page 8
J

Replace power supply again in the case that current power supply is also bad.

Errors found and fixed?

K

Divide network into two sections. Connect section 1 and move terminating resistor.

Network up?

Troubleshoot other 1/3 of the network

K

DisConnnect Section 1. Connect Section 2 and move terminating resistor.

Network up?

L

See Page 9

See Page 9
L
Replace scanner. Reconnect entire network.

Bus off condition fixed?
Yes
No

Isolate problem
Check for issues in cabinet

Problem Solved
Yes
No

M
Rewalk network looking for stressed cables (e.g. bend radius too tight, tie wrapped where it causes failure)

Any shorts or opens?
Yes
No

Fix problem

Go to N
See Page 10

Done

Check for potential network load issues.

Check for wiring and other nodes within the scanner cabinet.

See Page 10
N

Disconnect all nodes, add one node at a time until network communication fails. Determine node that causes bus off and replace

Still bus off?

No

Yes

GET HELP

Done

Yes

No
Start 2: DeviceNet Plant Floor Troubleshooting Flowchart (Intermittent Failures)

1. Do you have a DeviceNet diagnostic tool?
   - No
     - Go to Page 12
   - Yes
     - Connect tool to diagnose bus. (Monitor voltages, CAN frame errors, etc.)

2. Problem diagnosed?
   - No
     - Problem fixed?
       - No
         - Go to Page 12
       - Yes
         - Fix problem indicated
   - Yes
     - Done

See Page 12
Check noisy device’s grounding

Is the device’s grounding correct?

Fix grounding

Problem fixed?

Yes

Done

No

Go to R

See Page 14

Yes

VFD load dumps, Servos enabled, Welding, Other Maintenance in the Area (External to Network), etc.

No

Is problem occur with noise (from external device or event)?

Yes

No

Fix grounding

Go to Q

See Page 13

Grounding problem
Yes

Is there a noisy device on DeviceNet?

No

Replace DeviceNet interface card on that device

Go to R

See Page 14

e.g. VFD, Welding, Robot, Motor etc.

Yes

Problem fixed?

No

Done

Call Manufacturer
Check DeviceNet grounds (missing grounds or ground loops).

Grounds OK?

Yes

No

Fix grounds.

Problem fixed?

Yes

Done

No

Go to F

See Page 5
**Start 3: DeviceNet Plant Floor Troubleshooting Flowchart**

*(Node Problem)*

If this is your third time through this process, consider the possibility that this is a network issue rather than a node issue.

1. **Turn Auxiliary and DeviceNet Power OFF, Wait 10 seconds, Turn back ON.** Verify scanner is functioning.

2. **Is the Device’s Network Status LED flashing or solid green?**
   - Yes, **Done**
   - No, **Unplug device and check DeviceNet power and Auxiliary power at the node**

3. **Volatges OK?**
   - Yes, **Find and fix voltage problem**
   - No, **Is the device’s Network Status LED on solid red?**
     - Yes, **Go to S** (See Page 16)
     - No, **Go to V** (See Page 17)

4. **Is the Device’s Network Status LED solid green?**
   - Yes, **Go to V** (See Page 17)
   - No, **Go to Start 3** (See Above)
Verify node address and data rate. If no changes required, replace node. Be sure that node address, data rate and EDS revision are correct.

Is the device’s Net Status LED on solid red?

- Yes
  - Unplug node
  - Connect DeviceNet diagnostic tool

- No
  - Go to Start 3

See Page 15

Possible cable, tee or other node that is causing the problem

Can you see other nodes on the network?

- Yes
  - Disconnect DeviceNet diagnostic tool
  - Reconnect node. Disconnect adjacent nodes. Turn Auxiliary and DeviceNet Power OFF, Wait 10 seconds, Turn back ON.

- No
  - Replace drop cable or tee
  - Go to Start 3

See Page 15

Is the device’s Network Status LED on solid green?

- Yes
  - Go to T
  - See Page 17

- No
  - Go to U
  - See Page 17
One of the adjacent nodes may be causing the problem. Replace bad node. Reconnect nodes one at a time to confirm which node is causing the problem.

Go to Start 3

See Page 15

If the node’s Net Status LED is flashing green, it is ready to establish communication.

Check HMI or scanner for diagnostic information for corrective action.

Was corrective action successful?

Yes

Go to Start 3

See Page 15

No

Walk the network and check connections.

Go to W

See Page 18

Disconnect nodes until the device’s Net Status LED is on solid green.

Reset power after removal of each node to determine if problem has been corrected.

Reconnect nodes one at a time to confirm which node is causing the problem.

Replace offending node.

Go to Start 3

See Page 15

Done
Problem found and fixed?

Yes

No

Replace node

Node online?

Yes

No

Replace drop cable or tee

Node online?

Yes

No

Go to Page 17

Done
"Walking” the Network

Here are the things to keep in mind and look for when walking a network.

First try to look at a drawing or layout of the network so you know where the cables go and if the lengths are correct. Sometimes this is not possible but look around in the controller cabinet for this information. Also remember that Auxiliary Power topology and implementation is just as important as DeviceNet topology and implementation. Check both when walking the network (i.e. for additional information, see Auxiliary Power – Section 14 in the DeviceNet Network Checklist).

- Loose connections are the number one cause of failures.
  - Make sure all connections are undamaged.
  - Connections may look good but not be tight. Check them.

- Cable stress is the second thing to look for.
  - Cable radii might be too tight or stressed with tie wraps. There is a lot of vibration in a plant and if the cables are stressed it will create a failure point.
  - Some cable trays are mounted on long fence post and the cables brought down from them. At the point where they leave the cable tray and bend down could be a potential spot for failure.

- Grounds are very important!
  - Visually inspect grounding to assure that grounding location is clean and connection is tight. Make sure that all components are properly grounded.

- Separate high voltage cables from DeviceNet cables!
  - Power, welding or servo cables are sometimes put on top of the DeviceNet cables or put in the same cable trays. DeviceNet cables must have the proper distance between these cables.
  - To clean up the wiring power, servo, or welding cables are tie wrapped together. DeviceNet cables must have the proper distance between these cables.
Segmenting a network to troubleshoot a problem.

Finding a network cable problem is sometimes not the easiest thing to detect. The following step-by-step process will assist in locating cabling issues:

- Divide the network into two halves to determine which half is causing the trouble by physically disconnecting the trunk cable and placing the terminating resistor at the break point
- Once you determine the half causing the trouble you can approach the problem two ways.
  - Continue to divide the defective portion of the network in half to further isolate the trouble; or
  - Re-walk the network making sure that all connections are still “OK”. If everything looks “OK” then start at the controller and go to the first drop. Break the trunk cable and insert a terminator. Walk the terminator down the trunk until the network fails.

Once the problem location has been determined, consider the following cable connection / details as possible causes of the problem:
  - Tee Connection
  - Drop Connection
  - Node Connection
  - Loading problem with a node or insufficient bus power. (A volt-amp-meter should be used to determine if the problem is related to bus loading).

If the network has been running and then fails, it is often due to a bad cable or “Tee” connection.

Remember: There could be one or more causes for a specific problem. Take your time and check thoroughly to minimize the possibility of missing something.
DeviceNet Network Checklist

The following items should be completed during the implementation of DeviceNet networks commissioning. This will act as a record of the values attained after installation of a working network and can be used for comparison for any future network / device troubleshooting.

</tbody>
</table>

Note regarding all Electrical Tests that follow:
Always keep the same reference point when making measurements. This allows you to trace wiring problems and find grounding problems. If you put the black lead on the Earth ground point, make sure you always use the same point and the same lead. When performing any resistance check, you cannot have less than “0” Ohms. A negative resistance value indicates you may have voltage on the ground, or on the wire you are checking. Remove the source of any voltage to get an accurate measurement.

--- | --- | --- | --- | ---
12 | Network Power Supply Ground Test

1. Turn all network power supplies off. Disconnect the V- and Shield wires from ground and from each other.

2. Using a Digital Voltmeter, measure DC voltage from shield to ground at all power supplies. Is there less than 1VDC?¹

3. Remove all sources of voltage before continuing.

4. Measure and record the DC resistance between V- and earth ground.

   Measured value should show infinite resistance. If other value is measured, look for swapped V- and shield wires at termination points.

5. Measure and record the DC resistance between Shield and earth ground.

   Measured values greater than 20kΩ are considered Normal. For measured values that are greater than 1 kΩ and less than 20 kΩ:
   
   - Disconnect both DeviceNet connectors on the top of the main control panel and repeat the above procedure. If the problem remains, check connections in the main control panel. Look for swapped V- and shield wires at termination points.
   
   - If the problem went away, segment the network and isolate the location of the problem, and check for grounded V- or Shield wires. Sometimes the V- and Shield connections are transposed, which would cause ground loops.

6. Reconnect the V- and Shield wires to ground.

7. Go to each end of the network and remove terminator. Check resistance between V- and Shield to verify that there is not a broken shield wire. DC Resistance should be < 20Ω.

   For measured values greater than 20Ω, check for broken shield

---
¹ Does not apply to applications in which flat cable is utilized for DeviceNet Communication.
<table>
<thead>
<tr>
<th>ID</th>
<th>Item Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>13</td>
<td>Network Power Supply Common Mode Voltage Test</td>
</tr>
</tbody>
</table>

1. Turn all network power supplies on.

2. Configure all nodes for their maximum current draw from network power. Turn on outputs that use network power.

3. Measure and record the DC voltage between V+ and V- where each power supply connects to the trunk.

4. Measure and record the DC voltage between V+ and V- at the ends of the network.

   Measured values between 11.0 VDC and 25.0 VDC are consistent with the DeviceNet Specification for proper DeviceNet communication.

   However, input devices that may rely V+ and V- for power may not operate properly at voltages less than 20 VDC. Check input device (e.g. proximity sensors, photoelectric sensors, etc.) to verify device is within voltage specifications.

5. Measure between V- and Shield. Measured values less than 4.6 VDC are considered normal.

   If measured value from:
   - Item 4. Is < 11.0 VDC; or
   - Item 5. Is > 4.6 VDC,

   The network may not operate properly.

   Possible solutions are:
   - Shorten the overall length of the network cable.
   - Move the power supply in the direction of the overloaded section.
   - Move nodes from the overload section to less loaded section.
   - Move high current loads close to the power supply.
   - Break the network into two separate networks.
   - Add power supply.

<td>Auxiliary Power Measurements</td>
<td></td>
<td>____</td>
<td><em><strong>/</strong></em></td>
</tr>
</tbody>
</table>

1. Monitor the voltage present at both ends of the auxiliary power trunk cable under normal operating conditions and record the high and low values observed. The use of an oscilloscope may be necessary.

2. Check all manufacturers’ specifications to verify that the auxiliary power observed falls within the manufacturers’ specifications.

   If problems are observed, consider the following:
   - Add an additional power supply
   - Shorten auxiliary power trunk line cabling
   - Check for influence of noise
   - Assure that the grounding requirements outlined in the manufacturers’ specifications have been met.
