

Machine-To-Supervisory Communication Framework based on OPC Unified Architecture

**Pedro Reboredo, M.Sc.
Bosch Rexroth AG**

Technical Track

www.odva.org

- ▶ **Introduction**
- ▶ **Requirement Analysis**
 - ▶ Communication Architecture
 - ▶ Controller-To-Field Level Communication
 - ▶ Machine-To-Supervisory Communication
- ▶ **Information Modeling**
 - ▶ CIP Data Model
 - ▶ sercos Data Model
- ▶ **OPC Unified Architecture**
- ▶ **Framework Concept**
- ▶ **Conclusion and Outlook**

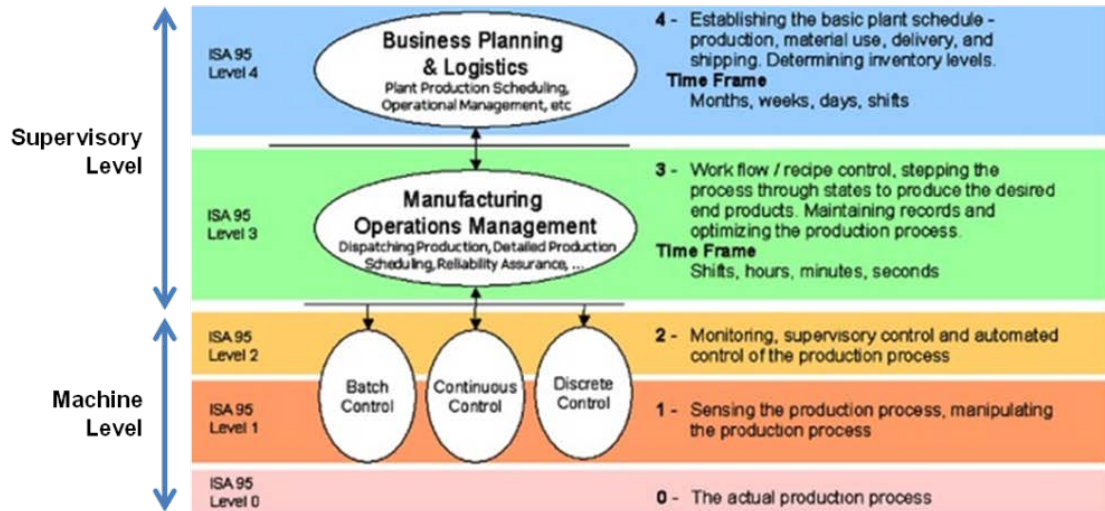

- ▶ **Industrial manufacturing** is an important factor for global economy
- ▶ **Automated production machines**
 - ▶ Enable constant product quality
 - ▶ Ensure wealth of industrial nations
 - ▶ Ensure high flexibility
- ▶ **Flexible manufacturing systems** are required due to:
 - ▶ Decreasing product life cycle times
 - ▶ Variety of product configurations
- ▶ **Holistic Machine Optimization**
 - ▶ Ensures business turnover
 - ▶ Enables productivity awareness
 - ▶ Needs high engineering efforts due to variety of communication protocols

- ▶ **Universal framework for machine-to-supervisory (M-to-S) communication enabling interoperability**

Sample Applications © Bosch Rexroth AG

Today's Communication Architecture

ISA-95 Manufacturing Levels according to [1] from [2]

- ▶ **Control feedback loops** are implemented between supervisory and machine level (ERP to technical process)
- ▶ **High efforts** exist for vertical integration due to variety of device suppliers and communication protocols
- ▶ Hardware **gateways** are mandatory

Controller to Field Device Requirements

- ▶ **Industrial Ethernet** based fieldbus protocols have gained acceptance during the last years
- ▶ **Ethernet** was already known from the office world
- ▶ Main **industrial** requirements:
 - ▶ **Determinism** (defined time slots) including Integration of **Synchronization** mechanisms
 - ▶ Integration of **COTS** hardware
 - ▶ **Availability** of products and components

M-to-S Communication Requirements

- ▶ **Open Standards**
 - ▶ Reduces vendor dependencies / minimize risks
- ▶ **Semantic Interoperability**
 - ▶ Same “language understanding” for information exchange between different suppliers
- ▶ **Security Mechanisms**
 - ▶ Prevent communication mechanisms from being misused (user authentication and authorization, data encryption)
- ▶ **Defined Interfaces**
 - ▶ Abstraction of application and communication by defining a way to describe (service) interfaces

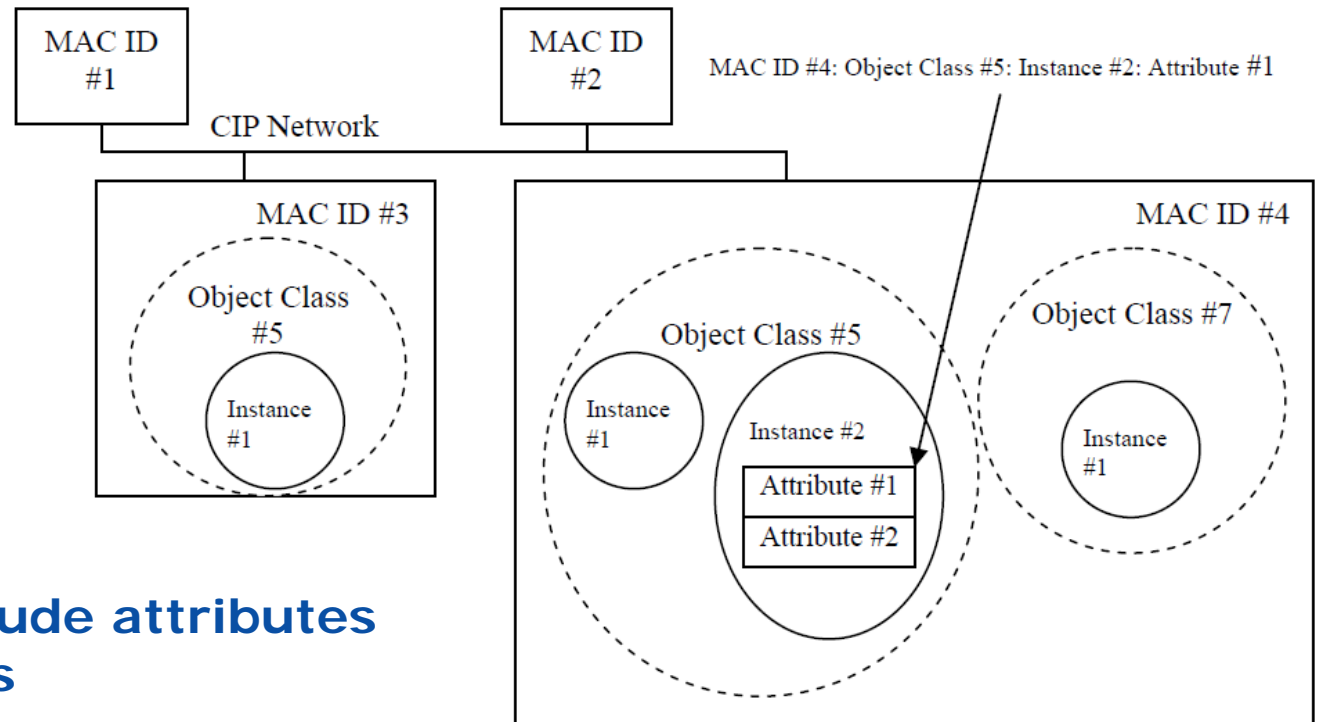

Goals:

- ▶ **Achieve Semantic Interoperability by**
 - ▶ ... defining a common information interpretation
 - ▶ ... creating entities and relationships
 - ▶ ... using defined mechanisms / a framework

- ▶ **Maximize Use Case Coverage by**
 - ▶ ... using an application layer of established protocols CIP and sercos

- ▶ **Main Goal:**
Use information models in a standardized architecture enabling secure communication mechanisms

CIP Data Model Overview

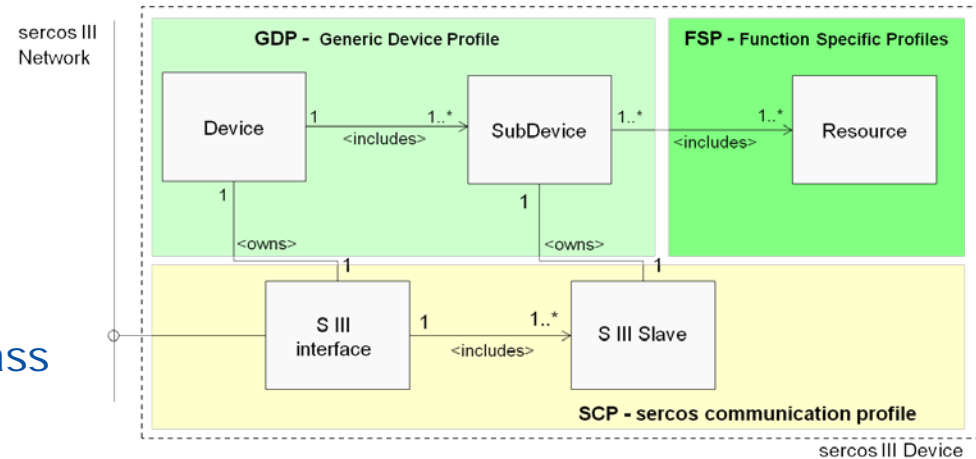

- ▶ **Objects include attributes and services**
- ▶ **Classes group objects**
- ▶ **Addressing data values by: Device.Class.Instance.Attribute**
- ▶ **8Bit, 16Bit and 32Bit addressing supported**

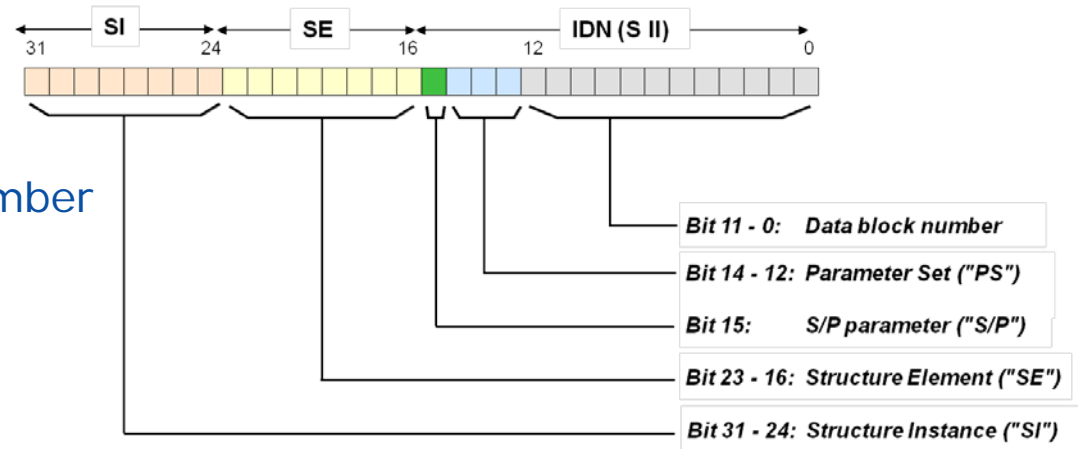

sercos Data Model Overview 1/2

sercos Data Profiles:

- ▶ **SCP – sercos Comm. Profile**
 - ▶ configuration of comm.
 - ▶ **GDP - Generic Device Profile**
 - ▶ Independent from device class
 - ▶ e.g. diagnosis, archiving
 - ▶ **FSP - Function Specific Profile**
 - ▶ Dedicated device class functionality
 - ▶ E.g. drive control parameters
-
- ▶ Each **device includes several profiles** covering different functional areas
 - ▶ Leads to **modularity** within a device

sercos Data Model Overview 2/2

sercos Parameter Model:

- ▶ **sercos III IDN**
 - ▶ 4 byte identification number
- ▶ **Data Block Number**
 - ▶ Data content
- ▶ **Parameter Set**
 - ▶ Multiple parameter sets
- ▶ **S/P Parameter Bit**
 - ▶ Standard or Product Specific Parameter
- ▶ **Structure Element**
 - ▶ Index of Element to be addressed
- ▶ **Structure Instance**
 - ▶ Instance of structure to be addressed

□ < IDN>.<SI>.<SE> e.g. S-0-1530.2.5

element No.	Description	Requirement
1	IDN	mandatory
2	Name	optional
3	Attribute	mandatory
4	Unit	optional
5	Minimum input value	optional
6	Maximum input value	optional
7	Operation data	mandatory

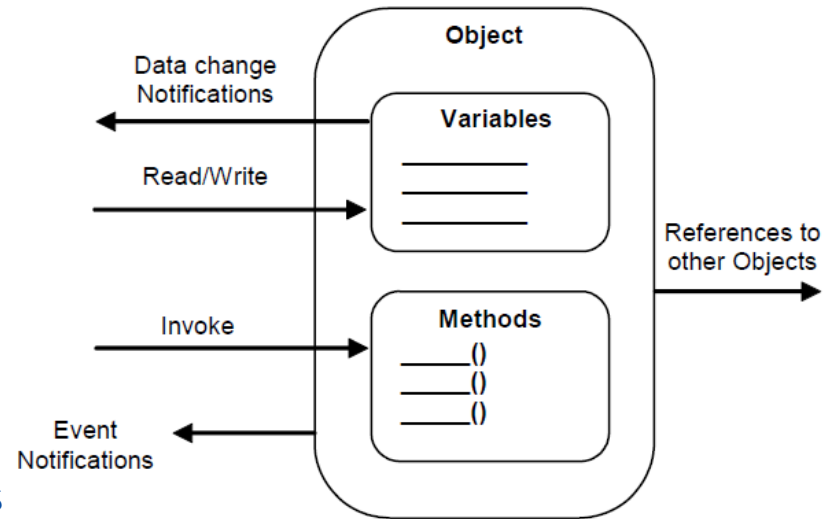

NOTE Elements 5 and 6 are mandatory for cycle time parameters (S-0-1050.x.10, S-0-1002).

OPC Unified Architecture

- ▶ **Middleware-technology**
- ▶ Extends the **OLE for process control (OPC)** standard
- ▶ Established technology for data exchange within factory automation and other applications
- ▶ **OPC UA Technology**
 - ▶ Integrates a semantic capable **information model**
 - ▶ Is based on **SOA**
 - ▶ Has **platform independency** (no Microsoft DCOM)
 - ▶ Has **TCP/IP** based communication protocol
- ▶ OPC UA is an **industrial de facto standard** for higher level interoperability

OPC UA Data Modeling

- ▶ **Nodes** are “atomic entities”
- ▶ Nodes are organized within the **server address space**
- ▶ **Objects** can
 - ▶ Include **Variables**
 - ▶ Include **Methods**
 - ▶ Send out **Event Notifications**
- ▶ **References**
 - ▶ Define **relations** between objects
 - ▶ Are **typed to express** the relationship
- ▶ Each **OPC UA Server** consists of an integrated address space containing information

- ▶ OPC UA server provides **standardized services**

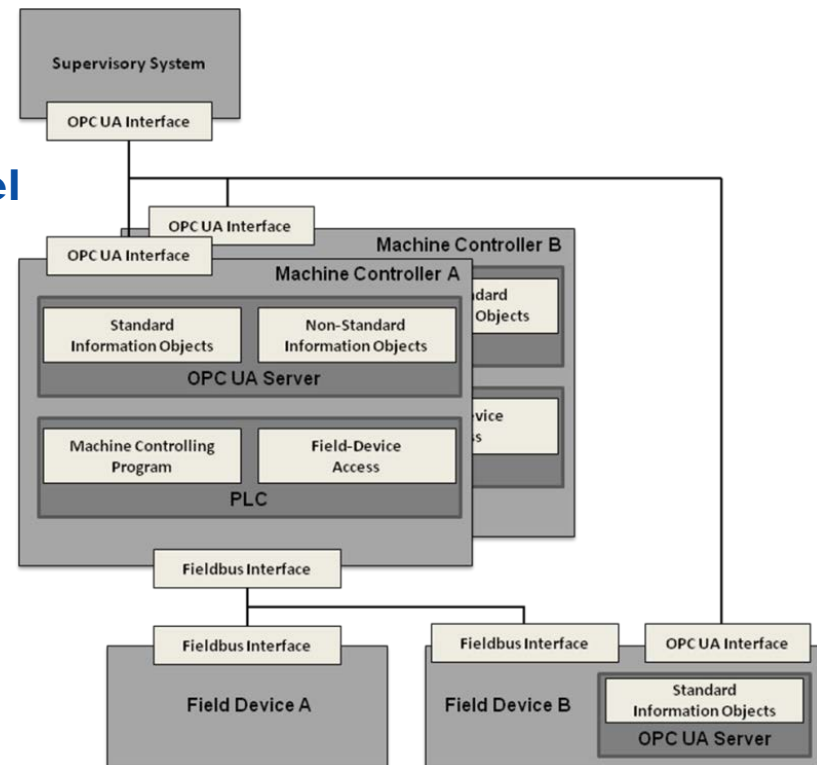

- ▶ **Discovery Service Set**
 - ▶ Server and endpoint discovery services
 - ▶ Servers can register themselves to one discovery server
 - ▶ Servers provide own discovery services
 - ▶ Useful with complex factory networks

- ▶ **Secure Channel Service Set**
 - ▶ Security mechanisms
 - ▶ Secure channel establishing between Client and Server
 - ▶ Security mechanisms are stack integrated

- ▶ **Methods Service Set**
 - ▶ Method invocation services
 - ▶ Includes interface definition (input and output arguments)
 - ▶ browse and query services for method discovery

- ▶ OPC UA based communication between supervisory systems and machine level
- ▶ **Machine Controller Information Model** has standardized and non standardized Information Objects
- ▶ Server can be **placed**
 - ▶ On Controller Level
 - ▶ On Field Device Level
- ▶ Standard models are defined via companion specifications for **interoperability**
- ▶ Non-Standard models include application data and enable **flexibility**
- ▶ Field Device Data is provided within the Server

Framework concept

Conclusions and Outlook

- ▶ Machine-to-supervisory communication is essential for holistic optimization of machinery
- ▶ Standardized information models facilitate the implementation efforts for machine data integration
- ▶ Introduced **CIP, sercos and OPC UA data modeling** concepts
- ▶ **Communication framework** to solve the problems of integration

- ▶ Standardization of suitable information models has to be advanced
 - ▶ E.g. Energy Management, Condition Monitoring

- ▶ Work in **O.M.I. task force** is still in progress

Thank you for your attention !
