Optimization of Machinery Information

Benefits of a Standard Method for Machinery-to-Supervisory Information Exchange

- For machine builders, optimization of machinery integration (OMI™) will create additional value through simplified communication from machines to supervisory systems such as SCADA and MES.
- By transforming data into information, OMI will:
 - Provide tools for dynamic decision-making to maximize machine productivity and improve machine performance
 - Enhance maintainability of machinery assets
 - Create more value from machines

OMI will emerge as a natural sweet spot to help manufacturers meet their overall business objectives, including workforce, profitability and sustainability goals.

What ODVA is Doing About It

- White paper “Machinery Information Base Data Structure” presented at the conference and soon to be available online
- Machine-to-Supervisory
 - Mapping of data structures into CIPSE’s for CIP Object definition
 - Cooperating with OPC Foundation to map data structures into OPC-UA
 - Cooperating with sercos international to mapping data structures into Sercos
- Integration of other Object Models
 - Energy extended object with Energy SIG members
 - Condition Monitoring extended object
- Setup a model for Machine-to-Machine integration

Thank you!
