Industry Conference and 22nd Annual Meeting

## **The Future of 5G on the Factory floor**

**Rob Lodesky**

**HMS Industrial Networks**

# Table of Contents

Release 16 – Where are we today?

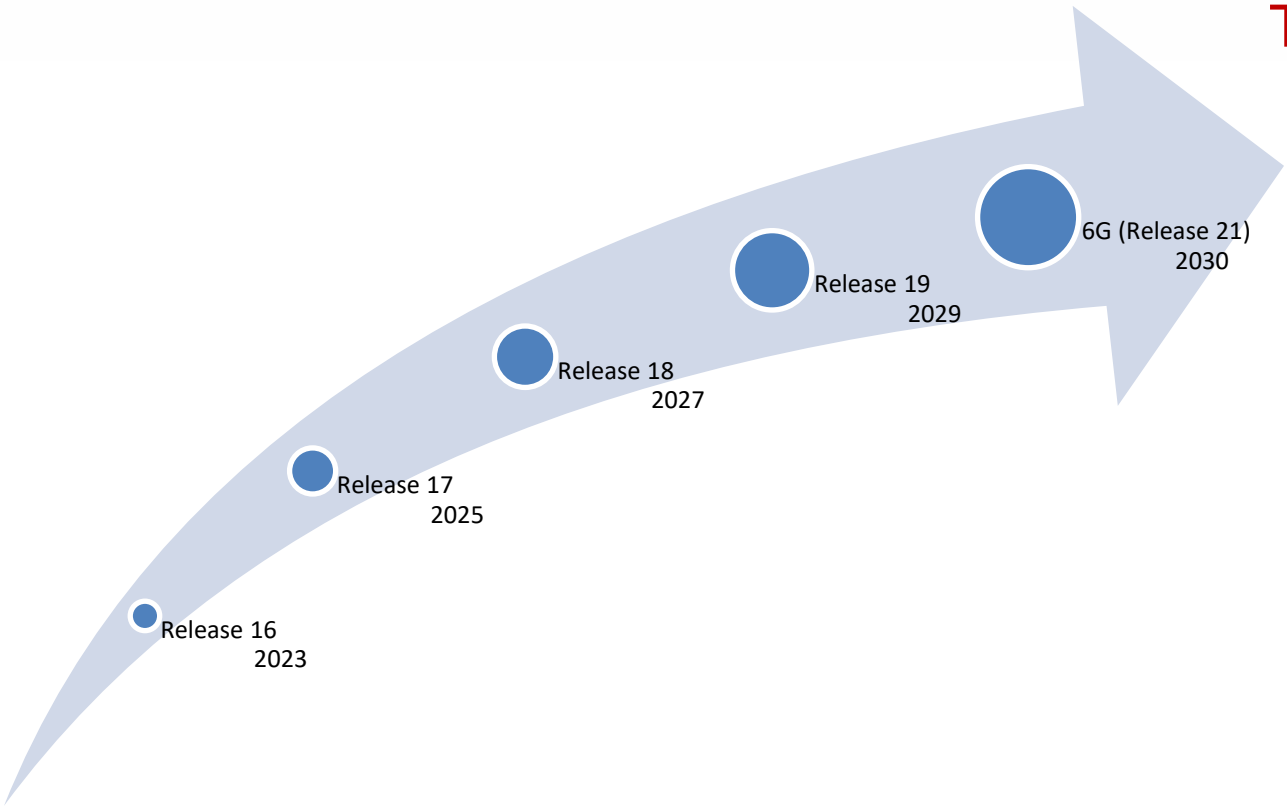

Release 17 – mmWave enhancement, RedCap, & Device Management

Release 18 – Industrial Sensor enhancement

Release 19 – Ambient IoT

6G – Below the 1 ms latency

# Timeline

## Release 16 Technologies

- URLLC enhancements
  - Traffic Scheduling enhancements
    - Priority of priorities
  - IP routable compression
  - Reliability enhancements through downlink sub-slot monitoring

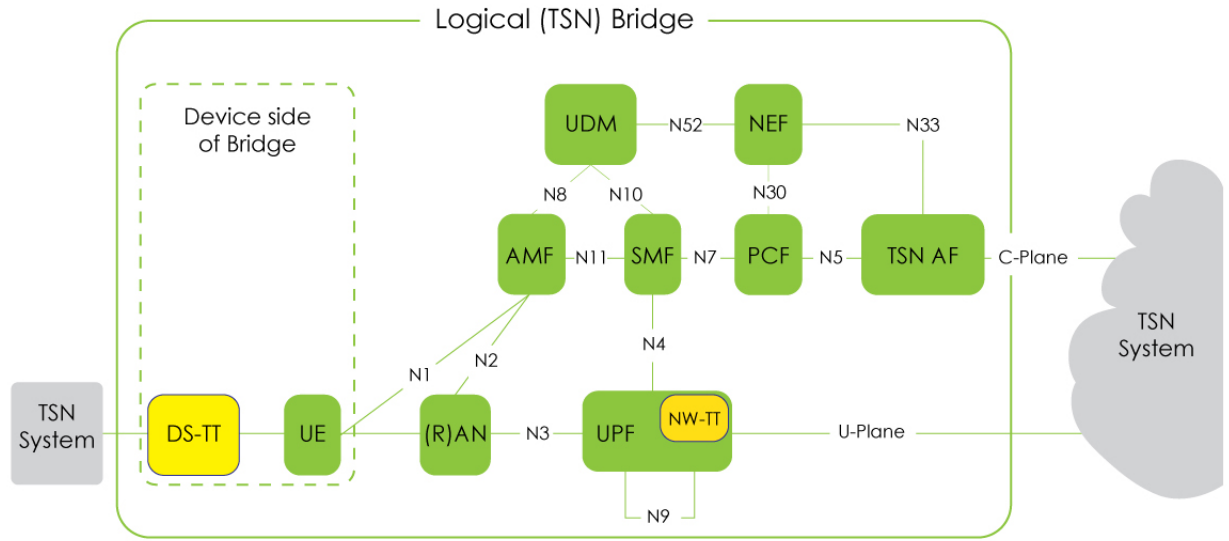

- URLLC enhancements

Haier pays special attention to the important role of 5G in the transformation and upgrade of smart manufacturing. Based on the COSMOPlat industrial Internet platform, that is combined with the characteristics of high bandwidth, low latency, dedicated secure network, and flexible O&M provided by 5G deterministic networking, the Haier interconnected factories effectively improve production management efficiency, reduce costs, and improve quality. This enables the realization of “user experience centric” mass customization and continuous satisfaction of users’ better life.

-Zhang Weijie, Executive Director of Haier Institute of Industrial Intelligence

# TSN Enablement

System architecture view with 5GS appearing as a Time-Sensitive Networking bridge

TS 23.501

“

After the reconstruction into automation, one worker can remotely monitor multiple RTG cranes at the same time. This greatly improves the working environment for employees, reduces the labor cost of port enterprises, and resolves recruitment difficulties. ZPMC once tried to use Wi-Fi and 4G to build port communications infrastructure. However, these solutions could not meet the requirements of large bandwidth, low latency, wide coverage, and mobility. 5G makes all this possible.

-Shan Lei, General Manager of the technical R&D center of ZPMC

# Continued Challenges

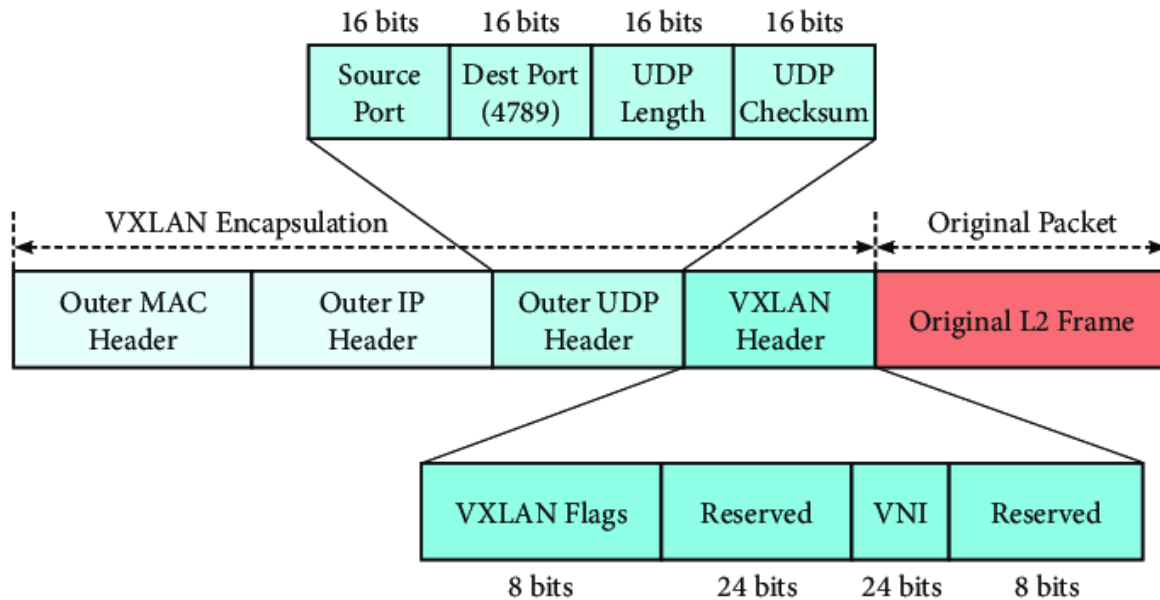

- IP routing challenges
  - SGMP Snooping
  - Discovery protocols
  - DLR
    - Layer 2 protocols

## Continued Challenges

- IP routing solutions
  - Ethernet PDU's
  - GRE
  - VXLAN

# Continued Challenges

## mmWave Enhancements

- Higher frequency, shorter lengths
  - Beamforming can increase this
- Much larger Bandwidth
  - 40x Compared to 4G

- Within mmWave range
- Short or long packet processing necessary
- Possible control loop thru 5G

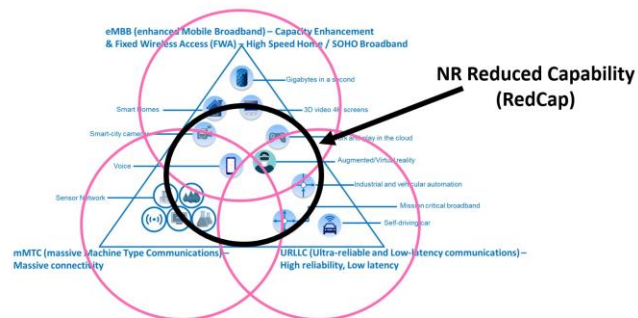

## mmWave Enhancements

## Reduced Capacity (RedCap)

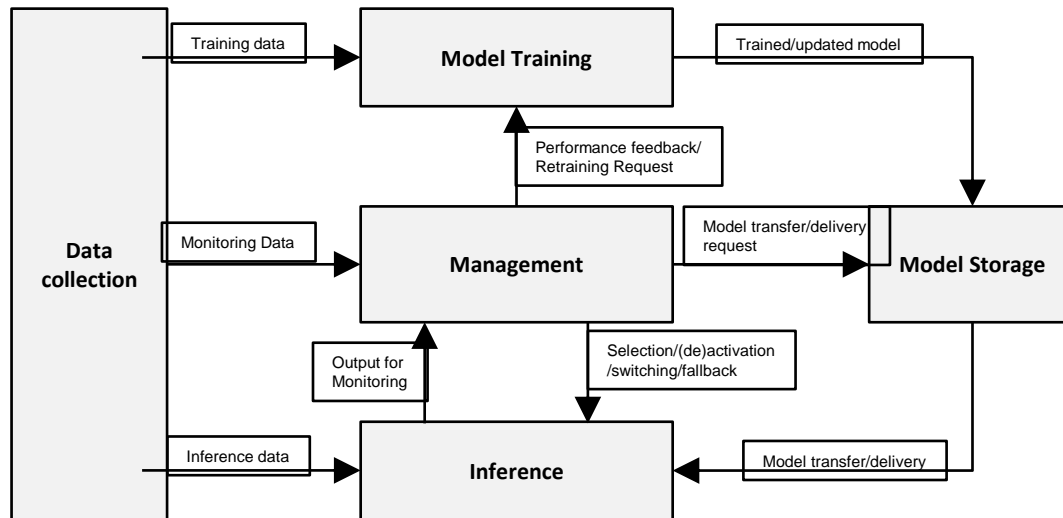

- Power efficient 5G
- Better determinism, lower cost products
- Reduced cost, battery powered sensors

### Release-17: Motivation for NR Reduced Capability

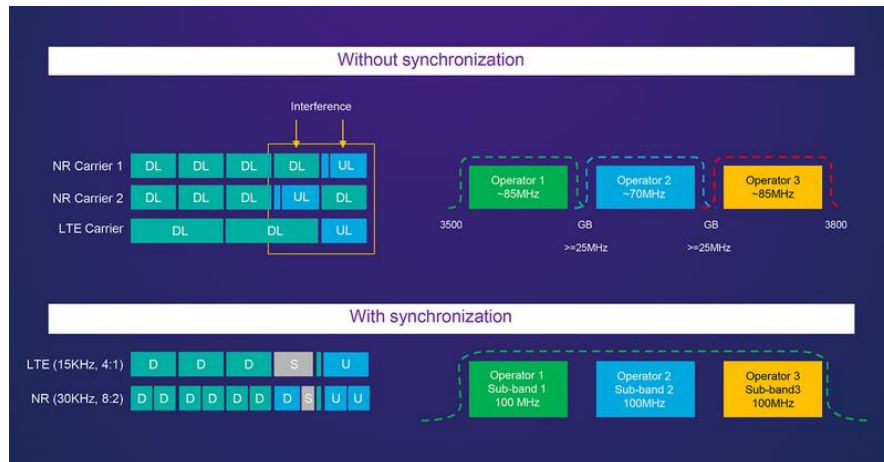

## URLLC Enhancements

- Enable Timing principles on the Transport network
- Timing Synchronization status and reporting
- Service time based on Subscription

# URLLC Enhancements

## Timing Synchronization status and reporting

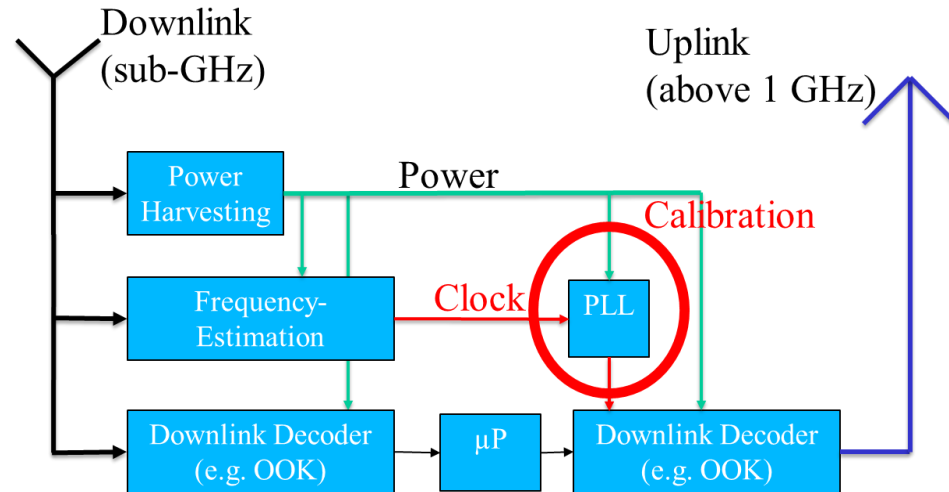

## Service time based on Subscription

0953

- Ambient IoT
- Batteryless Connectivity
- Overall Goal: Integrated sensing and communication

- Biggest Energy consumer is crystal Oscillator
- Use the signal!

Topology 3a with downlink assistance

Topology 3b with uplink assistance

Topology 4

# Failure of RFID

RFID only fits short range single-point operation, still needs **human resource**

RFID does not support large area continuous coverage, infeasible to meet industry demand of whole-process automation

Source: Global RFID Sensor Market, Global Industry Analysis, Size, Share, Growth, Trends and Forecast, 2021–2031

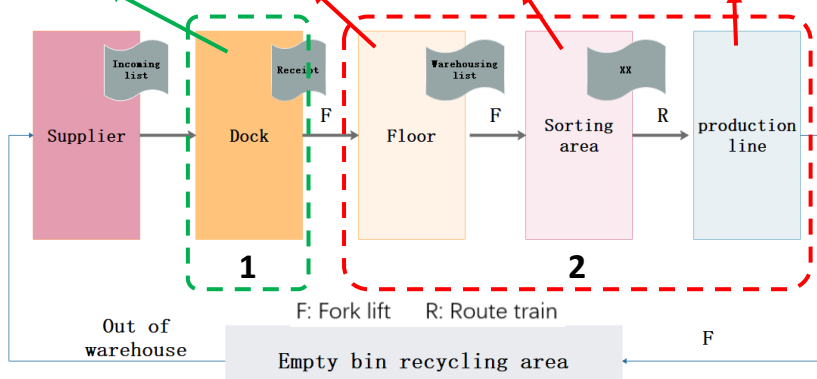

# Ambient IoT for Intralogistics in Automobile Manufacturing

## Dock

- **Fast Reading for non-stop forklift**
  - 100 tags/s
- **In/out detection of forklift**
  - Tag moving direction

## Floor, Sorting area, Production line

- **Block detection of containers**
  - Positioning to detect the block in which a dedicated tag is placed, with accuracy of 1~3 meters
- **Seamless coverage**
  - Simple deployment and network planning
- **Real-time inventory**
  - Thousands of tags read in a few minutes

Typical plant covers a total area of around 400,000 ~ 600,000 square meters

## Commercial deployment of RFID in dock area of factory

1

### RFID has been commercially deployed in the dock area :

- Short communication range is not a problem as all tags go through gates

Equipment	Maintenance	Tag	Total
X	2X	4.6X	7.6X

RFID in dock area

30 Readers @ 20 gates; 800,000 tags

## Extension to all areas of factory

2

Ambient IoT 20~30m

RFID~10m

To cover a total area of 1300\*18m\*18m, the cost of RFID and Ambient IoT are as follows

Equipment	Maintenance	Tag	Total
223X	7.6X	4.6X	235.2X

6581 Readers and 800,000 tags

Ambient IoT  
Coverage: 18m\*18m  
Positioning: 1~3m@90%

Equipment	Maintenance	Tag	Total
44X	7.6X	4.6X	56.2X

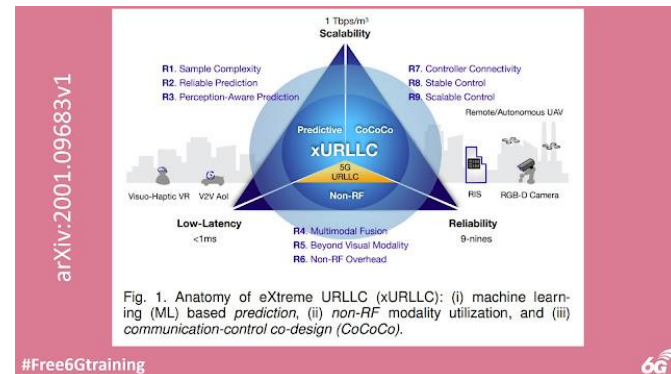

1300 Readers and 800,000 tags

- RFID is only suitable to be deployed in dock area, a small part of factory
- Seamless coverage and positioning are key requirements for mature solution

- More data, less distance
- Deterministic gap

- Embedded machine learning
- RF & non-RF
- Joint communication & Control Design
